### AD2000 Ready DAQ AD128 Data Logger

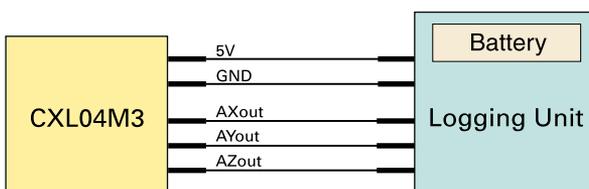

The AD128 is a complete stand-alone data acquisition system, including a pocket-sized logging unit, Configuration & Analysis Software and all accessories. The system provides a method for logging data directly from Crossbow accelerometers. The AD128 logging unit will operate from a 9 volt battery for up to 3 months when power is not being supplied to sensors. While supplying power to Crossbow accelerometers, the logging unit will operate from a single battery for 8 to 150 hours, depending on the accelerometer model.

The AD2000 is an enhanced data acquisition system with 2 megabytes of memory, 12 input channels, and peak-record and event duration filter mode options for use with accelerometers. The AD2000 works with power supplies up to 35 Volts and includes transient and surge protection to 80 Volts.

The full-featured Configuration & Analysis Software is shipped with each system and enables immediate use of the system right out of the box. The form-based setup is extremely intuitive and makes immediate use of the system possible, for evaluation and useful data collection with Crossbow accelerometers. Once data has been recorded, a single mouse click retrieves the data into a built-in spreadsheet, from which another mouse click generates a pre-formatted graph for immediate analysis. The Configuration and Analysis Software runs on Microsoft® Windows®.

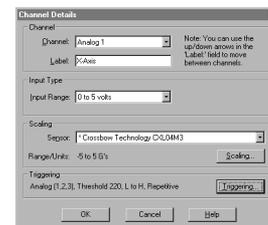

The AD128 logging unit records from all 8 analog and 14 digital inputs (or selected inputs) simultaneously, as fast as 500 samples per second, with a single touch of a button. Alternatively, recording can be triggered by a specified condition on the input signal levels, thus eliminating unwanted information.

Sample records are logged with the time and date of the built-in real-time clock. The 10-year battery-backed data memory and software interlock ensure that data won't be lost or accidentally erased. All inputs are protected to  $\pm 20$  volts.

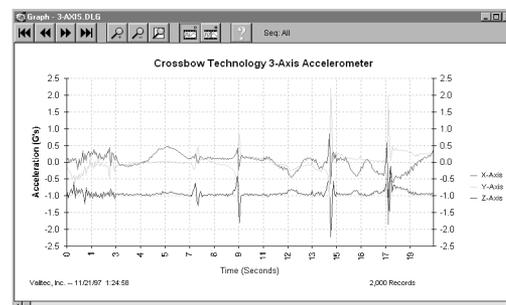

Specifications	AD128 AD2000	Remarks
