# AP THERMISTOR

The AP Thermistor features higher accuracy and higher resistance to heat than our existing high-precision thermistor. AP Thermistor suits various types of application.

## Features

- Super high-precision : Tolerance on  $R_{25}$  and  $B_{25/85}$  is  $\pm 0.5\%$ .
- Narrow deviation in wide temperature range: Accurate temperature detecting with tolerance of  $\pm 0.5^\circ\text{C}$  in  $-60^\circ\text{C}$  to  $70^\circ\text{C}$ .
- High resistance to heat : Category temperature range is  $-60^\circ\text{C}\sim 150^\circ\text{C}$ .

## Applications

Portable devices, Battery packs, Fan motor, Automobile, Office automation equipment, Electrical household appliances, Security devices, Thermometer, Measurement equipment, Temperature detecting, etc.

## Part number

## Dimensions

This products complies with RoHS

## Temperature accuracy

## Rating and characteristic

Part No.	$R_{25}^{*1}$	B value <sup>*2</sup>	Dissipation factor (mW/°C) Approx.	Thermal time constant(s) <sup>*3</sup> Approx.	Rated maximum power dissipation(at 25°C)(mW)	Category temperature range(°C)
202AP-2	2.00kΩ	3976K	1.2	15	6	-60~150

## NC SENSOR

NC SENSOR is the remote temperature sensor consisting of two precision thermistors.

### 1.Features

- Larger output in comparison with other IR sensors.
- Operating temperature of up 150°C.(M-type : 130°C)
- Minimum negative influence caused by a dew and/or dust.

### 2.Applications

- Temperature measurement of the LBP and PPC heat-roller.
- White goods such as microwave-ovens, air-conditioner, refrigerator and so on.
- Any other measurement requiring the remote-sensing.

### 3. Dimensions

### 4.Specification

Parameters	F-type (for heat-roller)		M-type (for microwave ovens)	
	Performance	Conditions	Performance	Conditions
Temperature Accuracy	180°C±3°C	Blackbody Temperature : 180°C Thermal Emissivity : 0.96 Temperature compensation : 100°C Roller Size : 40mm Testing Distance : 5mm Resistor Connected : 33.0kΩ Power Line Voltage : DC 5.000V	60°C±5°C	Blackbody Temperature : 60°C Thermal Emissivity : 0.995 Temperature compensation : 25°C Resistor Connected : 68.0kΩ Power Line Voltage : DC 5.000V
Category Temperature Range	-10°C~150°C		-10°C~130°C	
Temperature Detecting range	-10°C~260°C		-10°C~100°C	

The NC SENSOR is a custom-made product.  
Please consult our sales staff.

# THERMISTOR

"Thermistor" is the generic name given to thermally sensitive resistors. Negative temperature coefficient thermistor is generally called as thermistor. Thermistor is a semiconducting ceramic resistor produced by sintering the materials at high temperature and made mainly from metal oxide. Depending on the manufacturing method and the structure, there are many shapes and characteristics for various purposes such as temperature measurement, temperature compensation and etc. The thermistor resistance values, unless otherwise specified, are classified at a standard temperature of 25°C. B value is calculated from the resistance values at 25°C and 85°C.

## Resistance-Temperature Characteristics

The resistance of a temperature is solely a function of its absolute temperature. Since electrical power being dissipated within a temperature might heat above its ambient temperature and thereby reduce its resistance, it is necessary to test for resistance with temperature. The resistance so measured is called  $R_T$ , which means the resistance at essentially zero-power.

The mathematical expression which relates the resistance and the absolute temperature of a thermistor is as follows:

$$R_a = R_b \exp \left[ B \left( \frac{1}{T_1} - \frac{1}{T_2} \right) \right]$$

Where:  $R_a$  is the resistance at absolute temperature  $T_1$   
 $R_b$  is the resistance at absolute temperature  $T_2$   
 $B$  is a constant which depends on the material of the thermistor

Unless otherwise specified, all values of  $B$  are determined from measurements made at 25°C and 85°C.

The temperature coefficient of resistance  $\alpha$  is expressed in the following equation:

$$\alpha = - \frac{B}{T^2} \times 100 (\%/^{\circ}\text{C})$$

## Dissipation factor

Dissipation factor ( $\delta$ ) is power in milliwatts required to raise thermistor temperature 1°C. Measured with thermistor suspended by its leads in a specified environment.

$$\delta = \frac{P}{\Delta t} \text{ (mW/}^{\circ}\text{C)}$$

$P$  : Power (mW)

$\Delta t$  : Raise temperature (°C)

## Thermal time constant

Thermal time constant ( $\tau_a$ ) is the time required by a thermistor to change 63% of the difference between its initial and final temperature. Measured with thermistor suspended by its leads in specified environment.

# ULTIMATE THINNESS, JT THERMISTOR

SUNSTAR传感与控制 <http://www.sensor-ic.com/> TEL:0755-83376549 FAX:0755-83376182 E-MAIL:szss20@163.com

## 500 $\mu$ m only

## JT THERMISTOR

JT thermistors feature ultra thinness of 500 $\mu$ m and superior electrical insulation. It is possible to use with safety in ambience that might contact with electrodes.

## AT THERMISTOR

The AT thermistor is a high-precision thermal sensing device featuring extremely small B-value tolerance and resistance.

When used as a temperature gauge, the AT thermistor requires no adjustment between the control circuit and the sensor.

This insures temperature precision of  $\pm 0.3^{\circ}\text{C}$ . Temperature indicators and control instruments are now available for use with the thermistor.

# ET THERMISTOR

The ET thermistor is smaller version of the AT thermistor. Its fast response time and high reliability makes it particularly suitable for use in medical equipment and thermometers. Manufactured by full-automated production line, all ET thermistors have identical size and that makes it possible to assemble sensors automatically.

# ACCURATE AXIAL TYPE THERMISTOR

SUNSTAR传感与控制 <http://www.sensor-ic.com/> TEL:0755-83376549 FAX:0755-83376182 E-MAIL:szss20@163.com

## IT THERMISTOR

Our newly developed IT thermistors are axial leaded diode type packaged in high-density resin mold and featured strength against various operating environments.

We offer IT thermistor with  $\pm 2\%$  tolerance for a resistance value of 25°C and  $\pm 1\%$  for B value. IT thermistors are the most appropriate device for accurate temperature control below 100°C.

# SURFACE MOUNT TYPE THERMISTOR

SUNSTAR传感与控制 <http://www.sensor-ic.com/> TEL:0755-83376549 FAX:0755-83376182 E-MAIL:szss20@163.com

## HT THERMISTOR

HT thermistors are entirely new type of thermistor for surface mounting (by reflow soldering) and were acquired from advanced technology.

Our HT thermistors are adapted metal electrodes packaged in a resin mold, unlike conventional chip thermistors, and can offer  $\pm 2\%$  tolerance for a resistance value at 25°C.

HT series (SMD Thermistor) is not only compact-surface mounting type but also highly accurate and reliable.

Unit (kΩ)

# FL THERMISTOR

The FL Thermistor is developed on technology of the FT Thermistor. The FL Thermistor has "lead-wings" that makes mounting on the boards much easier.

## Part number

\*2 : in still air

## FT THERMISTOR

The FT thermistors, the highly reliable thermistors, are characterized by their fast response time, which was made possible by the miniaturization of the thermistor dimensions. FT thermistors are also heat-resistant type. FT thermistors are the most excellent products of today's chip thermistors manufacturing.

### Part number

### Dimensions

Electrode type	Connection method
Pt	Conductive resins
Au	Wire-bonding
Au/Ni	Solder

We can also custom-make FT THERMISTOR to better suit your applications. Please consult our sales staff.

### Specifications

Part No.	$R_{25}^{*1}$	B value <sup>*2</sup>	Dissipation factor (mW/°C) Approx.	Thermal time constant(s) <sup>*3</sup> Approx.	Rated maximum power dissipation (at 25°C)(mW)	Category temp. range(°C)

Unit (kΩ)

## SMD type chip

Chip thermistors are specially processed, highly reliable thermistors.

They can be face-bonded to act as thermal compensators for ICs and they are manufactured in sizes down to 1 square mm, they can also be used to detect temperature with relatively small time constants.

### KT-type Part number

### Precautions

- Do not expose the thermistors to high soldering heat for more than specified time. (260°C for not longer than 10s is recommended)

### Dimensions

### Reflow soldering profile

### Taping (2125, 1608 type)

Minimum quantity:4000pcs/reel

### (1005 type)

Minimum quantity:10000pcs/reel

# HIGH HEAT-RESISTANCE AND HIGH SENSITIVE THERMISTOR

SUNSTAR传感与控制 <http://www.sensor-ic.com/> TEL:0755-83376549 FAX:0755-83376182 E-MAIL:szss20@163.com

## GT THERMISTOR

GT thermistor is combined both superior feature of BT thermistor and ET thermistor as fast response time, high reliability, wide category temperature range, high moisture proof, high accuracy and reasonable price.

GT thermistor is made up of a high quality thermistor element and the lead wire is connected to the thermistor element by alloyed technology, and glass coating for the thermistor element.

\*1 R<sub>25</sub>: Rated zero-power resistance value at 25°C.

\*2 B value: determined by rated zero-power resistance at 25°C and 85°C.

\*3 Time when thermistor temperature reaches 63.2% of the temperature difference. The value is measured in the air. (silicone oil)

# BT THERMISTOR

The BT thermistor is a small thermal sensing device providing high reliability, stable characteristics and a wide operating range of -50°C to 300°C. It is used in various applications including medical apparatus, industrial equipment and home electric appliances.

Unit(KΩ)

# CT THERMISTOR

The CT thermistor is a thermal sensor in a DO35 package. Similar to the BT thermistor, it is highly reliable and offers a wide operating range of  $-50^{\circ}\text{C}$  to  $(150^{\circ}\text{C})$   $250^{\circ}\text{C}$ . It is primarily used in home electric appliances and features a competitive price for full-automated manufacturing system.

\*1  $R_{25}$  : Rated zero-power resistance value at 25°C.

\*2 B value : determined by rated zero-power resistance at 25°C and 50°C.

\*3 Time when thermistor reaches 63.2% of the temperature difference. The value is measured in the air.

## TEMPERATURE COMPENSATION D THERMISTOR

The D thermistor, based on resistance changes, is used in transistor, coil and other temperature compensating circuits found in TV's, radio, etc.

\*3 Time when thermistor temperature reaches 63.2% of the temperature difference. The value is measured in the air.

# POWER THERMISTOR

The POWER THERMISTOR is a device for suppressing inrush current to an electric circuit. Circuits including electric bulbs or capacitors induce an inrush current more than 100 times the normal current when the circuit switch is turned on. The POWER THERMISTOR in the circuits protects electric equipments from being damaged by limiting the inrush current.

MARK II is a NEW POWER THERMISTOR featuring smaller size and larger energy capacity to meet severe requirements in inrush current suppression. There is the tendency of miniaturization in low power switching power supply, and MARK II is effectively applicable for the needs, though the comparatively larger sized fixed resistors (ceramic coat) are used now.

## Application

The power thermistor will suppress inrush current which is caused by a capacitor, filament for a bulb, inverter for fluorescent lamp, a heater and etc., also will control fan motor speed of cooler for electric circuit.

Especially MARK II was developed to use for power supply of TV, VCR instead of cement resistor.

## How to use the power thermistor

The most suitable power thermistor for the above circuit is required to fulfill the following terms and conditions.

1. The permissible current at ambient temperature of 55°C should be over 2A.
2. The thermistor resistance for suppressive current which becomes below 30A should be over 4.2 ohm from the under-mentioned formula.

$$\frac{\sqrt{2} V_E \times 1.1}{R_C + R_{25}} \leq 30$$

$R_C$  : Internal resistance value in the circuit is 1 ohm (100V/100A)

$R_{25}$  : Rated zero-power resistance at 25°C

3. Max. capacitance shall be over 2000μF at AC 100V.

Accordingly, suitable thermistors are 6D-22, 5D-18 and 8D-18, and if we consider in the points of small time constant which means a small size and large effect for suppressive current which means large rated zero-power resistance, 8D-18 is the most suitable one.

Use the following circuit in the power supply for 100V and 200V.

**Thermal time constant**

If ambient temperature of a thermistor is changed from T<sub>1</sub> to T<sub>2</sub> suddenly, temperature of the thermistor changes slowly. The time constant means the time when temperature of the thermistor reaches 63% of the temperature difference.

**Residual resistance**

If current is flowed through a thermistor, any heat will be generated in the thermistor by which its resistance will be decreased, however, a decrease of a resistance will be stabilized at a saturation resistance value which is determined by impressed electric power and a dissipation constant. The residual resistance value means maximum saturation resistance value when the maximum permissible current is flowed through the thermistor.

**Temperature coefficient α**

The temperature coefficient of a thermistor is expressed by the following equation ;

$$\alpha = -\frac{B}{T^2} \times 100 (\% / ^\circ\text{C})$$

**Dissipation factor**

If small voltage is applied to a thermistor, small current will flow which produce enough heat in the thermistor. Dissipation factor is electric power which make 1°C raise by heat in a thermistor.

$$\delta = \frac{P}{\Delta t} (\text{mW}/^\circ\text{C})$$

P is applied electric power.  
Δt is rised temperature of the thermistor.

**Maximum permissible current**

If the maximum permissible current flows to a thermistor at 25°C, temperature of the thermistor rises to 200°C, (160°C). When ambient temperature is above 25°C, the maximum permissible current shall be over reduced as the maximum permissible current reduction curve.

**Reliability tests**

**MARKII - type**

**Dry heat test**

Test sample is exposed in air at 200°C for 1,000 hours. ΔR25/R25 ≤ ±20%

**Damp heat test**

Test sample is exposed in atmosphere of 95%RH at 40°C for 1,000 hours. ΔR25/R25 ≤ ±10%

**Load test**

Test sample is applied the maximum rating current in air at 25°C for 1,000 hours. ΔR25/R25 ≤ ±20%

**Change of temperature**

Test sample is given 10 times of the following temperature cycle,  
→ -40°C for 30 minutes → room temperature for 5 minutes →  
→ 200°C for 30 minutes → room temperature for 5 minutes.  
ΔR25/R25 ≤ ±10%

**D-type**

**Dry heat test**

Test sample is exposed in air at 160°C for 1,000 hours. ΔR25/R25 ≤ ±10%

**Damp heat test**

Test sample is exposed in atmosphere of 95%RH at 40°C for 1,000 hours. ΔR25/R25 ≤ ±10%

**Load test**

Test sample is applied the maximum rating current in air at 25°C for 1,000 hours. ΔR25/R25 ≤ ±10%

**Change of temperature**

Test sample is given 10 times of the following temperature cycle,  
→ -10°C for 30 minutes → room temperature for 5 minutes →  
→ 160°C for 30 minutes → room temperature for 5 minutes.  
ΔR25/R25 ≤ ±10%

**D2-type**

**Dry heat test**

Test sample is exposed in air at 160°C for 1,000 hours. ΔR25/R25 ≤ ±15%

**Damp heat test**

Test sample is exposed in atmosphere of 95%RH at 40°C for 1,000 hours. ΔR25/R25 ≤ ±15%

**Load test**

Test sample is applied the maximum rating current in air at 25°C for 1,000 hours. ΔR25/R25 ≤ ±15%

**Change of temperature**

Test sample is given 10 times of the following temperature cycle,  
→ -40°C for 30 minutes → room temperature for 5 minutes →  
→ 100°C for 30 minutes → room temperature for 5 minutes.  
ΔR25/R25 ≤ ±15%

**Resistance-temperature characteristics**

The theoretical characteristics of a thermistor is expressed by following equation.

$$R_1 = R_2 \exp\left\{B\left(\frac{1}{T_1} - \frac{1}{T_2}\right)\right\}$$

R<sub>1</sub> is the zero-power resistance at absolute temperature T<sub>1</sub>  
R<sub>2</sub> is the zero-power resistance at absolute temperature T<sub>2</sub>

B is constant which depends on the material used to make the thermistor. Unless otherwise specified, all values of B are determined from measurements made at 25°C and 85°C.

## TRANSIENT VOLTAGE SUPPRESSOR

# VRD

VRD is a transient voltage suppressor used for protecting electric circuits from surge voltage and thus preventing breakdown. VRD has superior surge suppression characteristics, such as extremely fast response time, very low clamping voltage, and high surge capacity. Unlike metal oxide varistors, VRD does not have characteristics to change with surge variations within the rated capacity. This feature comprises another superior characteristics of the VRD as a transient voltage suppressors.

### Electrical characteristics

Figure 1 shows the electrical characteristics. Bipolar type has almost symmetrical breakdown voltage ( $V_B$ ) The reverse breakdown voltage of the ZD type is 200 Volts or more at 10 $\mu$ A DC.

Fig 1

### Taping

One of standard taping is as shown in Figure.

Fig 2

### Surge capability

Allowable surge capability ( $P_{PPM}$ ) is determined by the following equation:

$$P_{PPM} = I_{PPM} \times V_c$$

$I_{PPM}$ : Rated peak impulse current  
 $V_c$ : clamping voltage

The allowable surge capability (Rated peak impulse power dissipation  $P_{PPM}$ ) of VRD is shown in following Figure 3 and the surge capability derating characteristics are shown in Figure 6.

Fig 3

### Surge waveform

There are many types of surge waveform depending on the source of the surge. For the VRD surge suppression characteristics test, the EXP waveform shown below is used. The EXP waveform is shown as  $t_a/t_b$  depending on the time width, however 10/1000 waveform is used as the standard test waveform.

Fig 4

### Surge suppression characteristics

When EXP waveform is applied, the surge suppression waveform shown in the figure 5 can be observed.

Fig 5

### Power derating

NOTE : Nonsuffix : Bi-polar, suffix "U" : Uni-polar.

**Z6 type VRD has bipolar or unipolar electrical characteristics.**

Maximum ratings  
 Rated peak impulse power dissipation : 1.5kW(10/1000μs)  
 18.0kW(8/20μs)  
 Rated average power dissipation: 2W  
 Operating and storage temperature : -40°C to 125°C

## CURRENT REGULATIVE DIODE

# CRD

CRD is a diode which supplies constant current to an electric circuit, even when power supply voltage fluctuations or load impedance fluctuations occur.

CRD is used for current stabilization and current limiting.

### Basic characteristics

### Maximum ratings

	E type	F type
Rating power	300mW	400mW
Thermal resistance	300°C/W	150°C/W
Reverse current	50mA	
Operating temp	-30°C~150°C	

### Maximum rating voltage

Part No.	Voltage	Part No.	Voltage
E101L~E-562	100V	F101L~F-562	100V
E-822	30	F-822	50
E-103	30	F-103	42
E-123	30	F-123	34
E-153	25	F-153	28

\*1,2 Pinch-off current limiting current are measured by impulse wave at 25°C  
 \*3  $Z_T$  is minimum AC impedance when small AC signal voltage of 10KHz is added to 25Vbc bias.  $Z_T$  is used as the reference value.  
 \*4 Temperature coefficient is measured between 25°C and 50°C.  
 \* $I_{100V}/I_p$

### Taping

There are three Types for taping.

\*In principal elements are set with cathode side on the round hole side.

### Minimum taping quantity for

- Type 1 Roll.....5000pcs
- Box.....2500pcs
- Type 2 4000pcs
- Type 3 2500pcs

**Power derating**

**Pinch-off current Temperature**

**CRD in parallel**

The use of CRD in parallel increases their current handling capabilities.

**Increasing the voltage range using a zener diode**

Connecting zener diodes in series with the line ensures that the current is constant in high-voltage area.

**The compensation of current reduction due to self heating**

Placing resistors in parallel with CRD can correct any current decrease when the applied voltage increases. The following values are typical for correction resistors.

E-102	1MΩ	E-352	82kΩ
E-152	390kΩ	E-452	56kΩ
E-202	240kΩ	E-562	39kΩ
E-272	120kΩ		

Compensative resistor is not necessary if the current value is less than 1 mA.

**Dynamic characteristics (saturation characteristics)**

## METAL OXIDE VARISTOR

# ZENAMIC

ZENAMIC is the product name of a metal oxide varistor. ZENAMIC Transient/Surge Absorber, Series D is newly released through our continued research in ceramic material composition of ZnO varistor and manufacturing process, featuring large surge current handling capability and energy handling capability for absorbing transient overvoltage in compact size.

### Features

- Improved in "Surge Current Handling Capability (at 8/20 $\mu$ s, 2 times)" by about 2 times over the current.
- Very large "Energy Handling Capability" absorbing transient overvoltages in compact sizes.
- Lower Clamping Voltage for better surge protection.
- Fast response to high speed transient/surge voltage.
- Wide products range for transient/surge protection on AC 100V to AC 480V nominal system with the maximum peak current ratings of 600A to 7000A (at 8/20  $\mu$ s, 2 times).

### V-I characteristics

ZENAMIC has the forward-reverse symmetrical electrical characteristics as shown in the figure 1. The voltage-current curves show the varistor characteristics in the range 1 μA to 10<sup>4</sup>A, and show the resistance characteristics for the range under 1 μA and over 10<sup>4</sup>A in the figure 2. The voltage across terminals when test current(I<sub>t</sub>: 1 mA) is applied to ZENAMIC is the standard varistor voltage(V<sub>Z</sub>), and the voltage across terminals when a standard surge(I<sub>p</sub>) is applied represents the maximum suppression voltage(V<sub>C</sub>).

### Temperature characteristics

In the small current range, ZENAMIC features outstanding temperature characteristics. A shunt resistance R<sub>p</sub> of metal oxide varistor has the temperature characteristics which is determined by the following equation.

$$R_p = A e^{E_g / 2kT} \quad (2)$$

T: Absolute temperature  
k: Boltzmann constant  
A, E<sub>g</sub>: constants

As shown in the figure 3, the temperature dependence characteristics are shown clearly in the low current area.

### Surge waveform

A surge waveform varies according to the sources. An EXP waveform is used for surge testing of ZENAMIC, while a AC half-wave is used for the energy absorption test. The EXP waveform reaches its peak voltage (current) at [t<sub>a</sub>] as shown in the figure 5, and then decreases as time passes and reaches half of the peak voltage (current) at [t<sub>b</sub>]. This type of the EXP waveform is shown as a [t<sub>a</sub>/t<sub>b</sub>] voltage (current) waveform. For surge testing of ZENAMIC, the 8/20 μsec current waveform is used.

### Part Number.

### Application notes(General)

1. A surge excess of the specified Maximum Peak Current may cause short circuit or mechanical damage. The following measures are recommended.

- In case that ZENAMIC is used in line to ground, the ground fault circuit interrupter shall be applied in location A or thermally coupled fuse shall be applied in location C.
- ZENAMIC shall not be used near heat generating device and free from direct sunlight.
- ZENAMIC shall not be used near the flammable materials.

- 1) Location of the over current protector(circuit breaker or current fuse) shall be in the power line to the circuit(Location A) or in series with ZENAMIC (Location B).
- 2) It is recommended that a fuse listed in the table be put in location A or B.
- 3) In case that ZENAMIC is used in line to ground, the ground fault circuit interrupter should be applied in location A or thermally coupled fuse should be applied in location C.

Part Number	Z5D□□□	Z7D□□□	Z10D□□□
Rating of fuse	3A max.	5A max.	7A max.

Part Number	Z15D□□□	Z21D□□□
Rating of fuse	10A max.	15A max.

Refer to the related Safety Standards.

### Applications

Power lines and surge absorption units with error display (SA series).

1. Operating temperature range: -40 to 85°C
2. Storage temperature range: -40 to 125°C

### Dimensions

# GASTUBE ARRESTER

Gas tube arrester(GTA)is a surge absorber featuring low capacitance and high surge absorption energy.

It consists of a sealed tube in which inert gas is injected and electrodes which are set at fixed intervals. The simple structure and the dimensional accuracy offer high reliability and stabilized characteristics.

## Applications

1. Protection for telephone set, facsimile, telex, telephone system, CATV, computer and peripheral equipment.
2. Semiconductor circuit protection in equipment that also uses high voltage such as TV, oscilloscope, and electron microscope.
3. Automatic control of luminous energy in stroboscopic tube.
4. Generator of high-voltage for gas igniter.

## Voltage-Current Characteristics

The current through the GTA is changed over the range of values of  $10^{-18}$  to  $10^2$  amps which is shown as the figure below and the voltage across the GTA will also vary. The discharge characteristics are changed to various mode by the flowing current, and the final mode of the discharge characteristics is arc discharge.

When the applied voltage across the GTA exceeds the breakdown voltage (sparkover voltage), the current through the GTA increases rapidly to value of several amps or greater. The rate of current rise and level to be reached are limited by the series impedance of the circuit. The voltage across the GTA at this time is very low with typical value of 20 to 30 volts.

## Electrical Characteristics

### AC Discharge Current

The current is the rms value of sinusoidal alternating current of 50Hz or 60Hz which can flow through the GTA in accordance with a certain test method without substantially altering its sparkover voltage. The usual test consists of specified loads applied for 1 sec at interval of 1 min alternately. In the test of the maximum AC discharge current, the GTA is applied 9 cycles of 50Hz AC(180 ms) continuously.

### Impulse Surge Life

The life is defined as the minimum number of surges of a certain current waveform the GTA can survive without deterioration of its operating specifications.

### Insulation Resistance

This is defined as the resistance value across the terminal of GTA at 100V<sub>DC</sub> for devices over 230V<sub>DC</sub> (140V<sub>DC</sub> for GTA type) breakdown voltage and 50V<sub>DC</sub> for devices less than 230V<sub>DC</sub>(140V<sub>DC</sub> for GTA type) ratings.

### DC Breakdown Voltage

The voltage is the minimum slowly rising DC voltage that will cause sparkover when applied across the terminal of the GTA. The GTA shall be placed in darkness for at least 15 min and tested in this condition using a ramp voltage waveform with 100V/s to 500V/s.

The GTA shall be tested with a positive and a negative waveform. The sparkover current for DC sparkover voltage test shall be within 10 amps.

### Impulse Breakdown Voltage

The GTA to be exposed to the test shall be kept in total darkness before (for at least 15 min) and during the test. Then, with a ramp voltage with 5kV/ $\mu$ s applied to the GTA, the breakdown voltage level is recorded. In case of testing with opposite polarity, using the same GTA, a minimum of 15 min shall elapse.

## Maximum Single Impulse Discharge Current

This test is to determine the ability of the GTA to conduct a maximum single impulse Discharge current. The current impulse waveform is 8/20 $\mu$ s. The maximum single impulse discharge current is the crest current of the impulse.

## Capacitance

The capacitance of the GTA is defined as capacitance across terminals of the GTA at 1 kHz.

## Operating Temperature Range

-20°C~65°C

## DC Holdover Voltage

This values is defined as the maximum DC voltage across the terminals of the GTA which is expected to clear and restore its high impedance state within 150 ms or less after the passage of a surge.

## Impulse Waveform

Impulse breakdown voltage is the voltage at which the GTA fires when the voltage increases at rates of more than 100V/ $\mu$ s. This value may not vary even after the GTA has been stored in the dark for long period. The value of the impulse breakdown voltage increases with increasing steepness of the surge voltage as the figure below.

# CM2P type

A ceramic tube is sealed at both side by electrodes, and inside of it is filled up by inert gas. The ceramic type gas tube arrester has superior characteristics

such as mechanical strength, surge absorption energy and stability. There are two electrodes type and three electrodes type.

# SA01 type

The SA01 is a new product which can be utilized for protecting transient voltage in power supply of equipment with earth terminal.

For the equipment in which SA01 is used, the AC withstanding voltage between power lines and earth terminal can be tested without taking off "SA01".
